Please amend the Claims as indicated below.

6. (Amended) The device according to [one of claims 1 through 5]claim 1, wherein
the first cutting member is affixed in the conical front part of the housing;
the second cutting member is supported by a first spring installed in the conical front part, and is
connected to a first operating handle disposed at the middle of a body of the housing; and
the extrusion member is supported by a second spring installed in the body, and is connected to a
second operating handle disposed at the rear of the body.

7. (Amended) The device according to [one of claims 1 through 5]claim 1, wherein
the first cutting member is affixed in the conical front part of the housing,
the second cutting member is supported by a first spring installed in the conical front part, and is
connected to an operating handle disposed at the middle of a body of the housing, wherein a rear
portion of the operating handle is extended to a power transmitting member;
the extrusion member is supported by a second spring installed between a connecting axis to the
operating handle and a middle portion of the body, and is extended to the power transmitting
member; and
the power transmitting member comprises a gear which revolves with its axis affixed in the body,
wherein the gear engages with a thread which is formed on the bottom of a rear extension part of
the operating handle, and a thread which is formed on a top of a rear extension part of the
extrusion member, respectively.

8. (Amended) The device according to [one of claims 1 through 5]claim 1, wherein the first cutting member is affixed in the conical front part; the second cutting member is supported by a first spring installed in the conical front part, wherein triangle members are installed on the second cutting member at the position corresponding to a first operating handle disposed on the middle of a body of the housing, wherein a perpendicular face of the first triangle is arranged forwardly; the extrusion member is supported by a second spring installed in the middle of the body, and is connected to a second operating handle disposed at the rear of the body; and the first operating handle includes second triangle members, wherein a slope face of the second triangle member is sliding contact with a slope face of the first triangle member.

9. (Amended) The device according to [one of claims 1 through 5]claim 1, wherein the first cutting member is affixed in the conical front part; the second cutting member includes an extension part at the rear thereof, wherein an inner surface of the extension part has a thread engaged with a power-transmitting member linked to an electric motor; the extrusion member includes a thread engaged with the power-transmitting member on an outer surface thereof; and the power-transmitting member includes a thread engaged with the thread of the extension part, and a thread engaged with the thread of the extrusion member, wherein the two threads of the power-transmitting member are formed at the opposite direction to each other.

10. (Amended) A device, for harvesting tissues from human body for a histo-biopsy, comprising elements in [one of claims 1 through 9]claim 1.
